Technology-Facilitated Violence Prevalence and Associations Among a Nationally Representative Sample of Young Men

Nearly 1 in 3 men in US report any delivery or receipt of technology-facilitated violence (TFV) through cell phones, text messages, e-mails, or social media sites.

- Nationally representative sample of 1,079 men aged 18-35 surveyed to determine TFV prevalence and associations.
- Over 1 in 4 (26%) men reported TFV both delivered and received.
- TFV delivered-only was 4%.
- TFV received-only was 8%.
- Primary care physicians should consider assessing TFV/partner violence among male patients and developing TFV interventions.
